

Dental CRM Backend

Complete Change Report (Roman English)

Generated on: August 17, 2026

1. Session Ka Maqsad (Purpose)

Pehle poora backend code review kiya gaya tha taake bugs mil sakein. Us review ke baad 3 main bugs fix kiye gaye, 1 naya file add ki gayi, debug/temporary code hata diya, aur Uvicorn port issue samjhaya/fix kiya.

Yeh report usi bug review session ki detail hai.

File	Kya Change Hua	Kyun
backend/app/api/ai.py	Role bug fix + cleanup	Super Admin AI endpoints se block ho rahe thay
backend/app/database.py	Env path fix + security fix	Galat .env path + hardcoded DB password
backend/app/core/config.py	Debug code remove	Temporary logging hata di
backend/app/services/auth.py	Debug prints remove + simplify login	Passwords console par print ho rahe thay
backend/requirements.txt	Naya file add	README ke mutabiq missing thi

2. Bug #1 — AI Role Check (Super Admin Block Ho Raha Tha)

Problem: backend/app/api/ai.py mein management roles list galat thi. Code mein 'superadmin' likha tha (bina underscore), jabke system mein actual role 'super_admin' hai (underscore ke sath).

Is wajah se Super Admin users AI management endpoints par 403 Forbidden mil raha tha, chahe wo logged in hon.

- Pehle: MANAGEMENT_ROLES = ['superadmin', 'org_admin', 'clinic_manager']
- Baad mein: MANAGEMENT_ROLES = ['super_admin', 'org_admin', 'clinic_manager']
- Naya helper _normalize_role() add kiya taake UserRole enum bhi sahi match ho.
- require_role() ab role ko normalize karke compare karta hai.

3. Bug #2 — Database Config (Security + Wrong .env Path)

Problem A: database.py repo root (den-orm/.env) se env load kar raha tha, jabke asal .env file backend/.env mein hai. config.py sahi path use karta tha, lekin database.py alag path use kar raha tha.

Problem B: Agar DATABASE_URL na milta, code ek hardcoded Supabase PostgreSQL URL use karta tha jisme username/password source code mein likha tha. Yeh serious security bug tha.

- BASE_DIR ab backend folder point karta hai (parent.parent).
- Hardcoded fallback URL hata diya.
- Ab DATABASE_URL required hai; missing hone par RuntimeError aata hai.

- **Important:** Purani credentials git history mein ho sakti hain. Supabase par password rotate karna chahiye.

Fixed database.py logic:

```
BASE_DIR = Path(__file__).resolve().parent.parent
load_dotenv(BASE_DIR / '.env')
SQLALCHEMY_DATABASE_URL = os.getenv('DATABASE_URL')
if not SQLALCHEMY_DATABASE_URL: raise RuntimeError(...)
```

4. Bug #3 — Missing requirements.txt

backend/README.md kehta tha: pip install -r requirements.txt, lekin file exist nahi karti thi.

Aap ke virtual environment (.venv) se pip freeze karke naya file banaya gaya.

Path: backend/requirements.txt (~73 packages: FastAPI, SQLAlchemy, Supabase, bcrypt, OpenAI/Gemini client, etc.)

5. Cleanup — Debug Code Hata Diya

Bug hunt ke dauran temporary debug code add hua tha. Verification ke baad sab remove kar diya.

- auth.py: Login ke waqt plain text password aur hash console par print ho rahe thay — ab clean secure flow hai.
- config.py: Temporary JSON debug logging hata di.
- ai.py: _agent_log, DEBUG_LOG_PATH, extra imports hata diye.

Clean authenticate_user() flow:

```
clean_email = email.lower().strip()
user_with_pwd = await UserModel.get_by_email_with_password(clean_email)
if not user_with_pwd or not user_with_pwd.password: return None
if not _verify_password(password, user_with_pwd.password): return None
return await UserModel.get_by_id(str(user_with_pwd.id))
```

6. Uvicorn 'Not Running' Issue (Operational Fix)

Error: WinError 10013 — socket access forbidden.

Asal wajah: Port 8000 pehle se occupied tha (purani Uvicorn process). Doosri instance start nahi ho sakti.

- Port 8001 par server successfully start hua.
- Stale process port 8000 par kill kiya.
- Health check OK, login bhi 200 OK mil chuka hai.
- API docs: <http://127.0.0.1:8001/scalar>

Start command:

```
cd C:\workfiles\den-orm\backend
..\venv\Scripts\uvicorn app.main:app --reload --host 127.0.0.1 --port 8000
```

7. AI Endpoints Jo Fix Se Affect Hue

- POST /api/v1/ai/prompts
- GET /api/v1/ai/prompts/active/{feature_name}
- POST /api/v1/ai/usage

- POST /api/v1/ai/automation-rules
- GET /api/v1/ai/automation-rules/{organization_id}
- POST /api/v1/ai/automation-runs
- POST /api/v1/ai/knowledge/documents
- POST /api/v1/ai/knowledge/chunks

8. Jo Bugs Check Kiye Gaye Lekin Fix NAHI Kiye

Issue	Detail	Status
bcrypt vs passlib	Dono hash/verify sahi kaam kar rahe thay	No fix needed
Missing GEMINI_API_KEY	Aap ke env mein key maujood thi	No fix needed
Gemini model name	openai_service.py mein 'gemini-3.5-flash' — verify karo	Open
Frontend DATABASE_URL	Next.js app bina env ke crash ho sakti hai	Open
Supabase table 'Users'	Capital U — case-sensitive DB par issue ho sakta hai	Open
Old DB credentials in git	Purana hardcoded URL history mein ho sakta hai	Rotate credentials

9. Files Jo Change NAHI Hui

- backend/app/main.py
- backend/app/services/openai_service.py
- backend/app/core/auth_utils.py
- backend/app/models/*
- backend/app/schemas/*
- Frontend (src/)

10. Before vs After — Quick Comparison

Area	Pehle (Before)	Baad (After)
Super Admin AI access	403 Forbidden	Allowed (valid token ke sath)
Database env loading	Galat path + hardcoded fallback	backend/.env + required DATABASE_URL
Login security	Password console par print	No debug output
Dependencies file	Missing	requirements.txt added
Uvicorn on 8000	Port conflict	Stale process killed; 8001 working

11. Recommended Next Steps

- Supabase par database password rotate karo (purana hardcoded URL expose ho chuka tha).
- Super Admin se login karke AI endpoint test karo: GET /api/v1/ai/prompts/active/lead_summary
- Gemini model name verify karo: gemini-3.5-flash sahi hai ya nahi.
- Frontend ke liye .env.example add karo taake setup easy ho.
